9.3 Getting Help.....	17

1. System Overview

The Job Management System (JMS) is a web-based application built for Faith Lock & Safe to manage jobs, customers, technicians, and billing data from dispatch through payment approval. It replaces manual tracking and produces export files compatible with QuickBooks Desktop.

The system has two separate interfaces tailored to each user group:

Admin Panel	Used by Rich and Milton for scheduling, review, account management, and reporting. Accessed at https://old-north-analytics.github.io/FaithLS_POC/ .
Field App	Used by Thomas, Zach, and Milton on job sites for clocking in, completing jobs, and submitting quotes. Accessed at https://old-north-analytics.github.io/FaithLS_POC/ (same URL; the system routes automatically based on the user's role).

All data is stored in a cloud database (Supabase). No local installation is required. The application runs in Chrome or Firefox on any device with an internet connection.

2. Access and Login

2.1 Opening the Application

To access the system, open a web browser (Chrome or Firefox recommended) and navigate to: https://old-north-analytics.github.io/FaithLS_POC/. Sign in with your assigned email and password. The system automatically routes each user to the appropriate interface based on their assigned role. No software installation is required.

2.2 User Roles and Access

Role	Users	Interface Access	Sees Pricing
Admin	Rich Thurman, Milton White	Full admin panel	Yes
Tech	Thomas, Zach	Field app only	No
Milton (hybrid)	Milton White	Admin panel + My Jobs tab	Admin: Yes

Note: Milton is the only user who holds both roles simultaneously. His admin account is linked to his tech record, giving him the full admin panel plus an additional My Jobs tab that mirrors the field app.

2.3 Password Management

Passwords are managed through Supabase Auth. Admin can add users, change roles, and reset passwords from the Users tab under Settings in the admin panel. Contact Admin to request a password reset or to add a new user account.

3. Admin Panel

Rich and Milton access the admin panel by navigating to https://old-north-analytics.github.io/FaithLS_POC/ and signing in. Navigation tabs run across the top of the screen. The table below summarizes each section.

Section	Purpose
Dashboard	KPI summary cards and snapshots of today's schedule and review backlog
Dispatch	Full scheduling board grouped by date; assign, edit, and manage all jobs
Stock Prep	Aggregate expected parts and labor for a date range to plan truck loading
Review Queue	Approve completed jobs, set final pricing, upload photos, add admin notes
Quotes	Schedule or reject jobs in Quoted status from field quote submissions
Accounts	Customer CRM: contacts, job history, account instructions, photos
Settings	Manage reference data: parts, job types, labor types, techs, users
Export	Produce QuickBooks Desktop CSV from approved jobs
Activity Log	Chronological timeline of logins, clock events, completions, and reviews
My Jobs	Milton only. His assigned field work in the admin interface

3.1 Dashboard

The Dashboard provides a real-time snapshot of business activity for the selected time period. Period options are Today, This Week, This Month, and Custom date range. Refresh at any time using the Refresh button.

KPI Cards

Jobs on Board	Active jobs in Scheduled, In Progress, or Awaiting Parts status within the selected period.
Pending Review	All-time backlog count of jobs submitted by techs awaiting pricing and approval. Not date-filtered.
Open Quotes	Count of jobs in Quoted status awaiting scheduling or rejection decisions.
Approved Revenue	Total dollar value of approved jobs in the selected period, calculated from line items.

Below the KPI cards, two panels provide direct access: Today's Board shows up to eight jobs scheduled for the current day, and Needs Review shows the oldest jobs in the Pending Review backlog.

3.2 Dispatch

The Dispatch board is the primary scheduling tool. Jobs are grouped by date, with each date group showing a header with the day of week, date, and job count. Within each group, a table displays account, job type, assigned techs, work order number, status, and scope.

Filters

Filter	Description
Date Range	From and To date fields with quick buttons: Today, Tomorrow, This Week, This Month.
Tech	Narrows the board to jobs assigned to a specific technician.
Job Type	Shows only jobs of the selected type (lockout, rekey, safe service, etc.).
Status	All except Cancelled, Scheduled, In Progress, Awaiting Parts, Pending Review, Flagged, Quoted, or Approved.
Account	Live text search. Type any part of the account name to filter instantly.

Actions Available Per Job

Action	Available When	What It Does
Edit	All jobs	Opens the full edit modal. Contact info and site address are shown at the top. Change status, scope, WO/PO numbers, line items, visit clock times, and completion details.
Print	All jobs	Generates a printable job summary sheet with contact info, site address, scope, visit records, and line items.
Return Visit	Active jobs only	Adds a new scheduled visit date to an existing open job without creating a duplicate job record. Use this for multi-day jobs.
Delete	Pre-submission only	Permanently removes the job. Not available after a tech has submitted a completion. Cannot be undone.

Assign Job

Click the + Assign Job tab to open the job creation form. The form toggles between Existing Account and New Customer mode.

Account	Account typeahead search (start typing the account name). Sub-account dropdown appears after an account is selected. Contact info is pulled from the CRM and shown as a banner. Editable for this job only. Site address from the CRM with an override field for a different location.
Scheduling	Date and initial status. Job Type, Lead Tech, Assigned Techs (hold Ctrl or Cmd to select multiple). Work Order No. and Purchase Order No.
Scope	Scope of Work. Site Notes: gate codes, parking instructions, access restrictions. These print on the job sheet and display in the field app.
Pricing	Fixed Price toggle. When enabled, a quote amount field appears. Techs cannot see the dollar amount on fixed-price jobs.
Pre-load (optional)	Expected Parts: pre-load parts from the catalog. Feeds the Stock Prep view and populates the tech's completion form. Expected Labor: pre-load labor types and hours. Additional Charges: Service Call or Other with description and amount.

Note: New customers entered here are saved as pending accounts. Rich must approve them in the Accounts section before they appear in the active account list or in exports.

3.3 Stock Prep

Stock Prep aggregates the parts and labor pre-loaded on scheduled jobs for a selected date range. Use it to plan what to put on the truck before a day or week of work. Period options match the Dashboard: Today, This Week, This Month, and Custom.

Parts Required	Part name, category, unit, and total quantity needed across all jobs in the range. Sorted alphabetically.
Labor Summary	Labor type and total expected hours across all jobs in the range.
Jobs in Range	A table of all jobs in scope showing date, account, lead tech, status, and part/labor item counts per job.

Note: Only jobs in Scheduled, In Progress, or Awaiting Parts status are included. Jobs without pre-loaded parts or labor will not contribute to the totals but will appear in the Jobs in Range table.

3.4 Review Queue

The Review Queue is where Rich approves completed jobs and sets final pricing. Techs record all parts, labor, and charges at \$0. Rich reviews, adjusts, and approves from this view.

Standard Review Workflow

1. Tech submits a completed job from the field app.
2. Job status automatically moves to Pending Review.
3. Rich opens the Review Queue, finds the job, and clicks Details to expand the card.
4. Rich reviews visits, completion details, line items, and tech notes.
5. Rich sets override prices on line items where needed, with an override reason.
6. Rich clicks Approve to finalize, or Flag for follow-up.

Expanded Card Contents

Scope / Site Notes	Scope of work and any site notes entered at dispatch.
Visits	All visit records with dates and clock-in / clock-out timestamps.
Completion Details	Time in/out, payment type and detail, follow-up flag, submitted timestamp, and tech notes.
Line Items	Full table with unit cost, override price field, override reason field, and extended total per line.
Quote Form	Displayed if the job originated as a field quote (scope observed, materials noted).
Photos	Photo upload and viewer. Admin can add photos directly to any job from this view.
Admin Notes	A free-text note field. Notes are saved to the job's review history without changing its status.

Review Actions

Action	Effect
Approve	Marks the job Approved. Records the review with reviewer name, timestamp, and any notes.
Flag	Marks the job Flagged. Use when a job needs follow-up before it can be fully approved.
Reset	Returns the job to Pending Review. Use if approval was premature.
Edit	Opens the full edit modal (same as Dispatch board). Useful for correcting scope, WO/PO numbers, or clock times.
Print	Generates a printable job summary.
Bulk Approve	Approves all Pending Review jobs simultaneously. Use only when the entire backlog has been reviewed.

3.5 Quotes Pipeline

The Quotes pipeline shows all jobs in Quoted status. These are typically jobs where a tech went on-site, assessed the work, and submitted a quote form without performing any work. Each card displays the account, sub-account, site visit date, tech, tech notes, scope observed, and materials notes from the field.

Action	Description
Schedule as Job	Sets a scheduled date, assigns a lead tech, optionally sets a quote amount, and moves the job to Scheduled status. Creates a visit record for the scheduled date.
Reject	Cancels the quote with an optional reason note. Moves the job to Cancelled status.

3.6 Accounts (CRM)

The Accounts section is the customer CRM. All active accounts, contacts, job history, photos, and account instructions are managed here.

Account List

The list is searchable by name, address, and phone, and filterable by account type (master or sub-account) and active status. Columns sort by account name, job count, and last service date. Sub-accounts are shown indented below their parent master account.

Account Detail

Click Open on any row to view the full account record. Tabs within the detail view include:

Jobs	Full job history with status, date, and job reference numbers. Links directly to the edit modal.
Contacts	All contacts associated with the account with full details and role flags.
Quotes	Quote forms submitted for this account by field techs.
Photos	All photos uploaded in connection with this account's jobs.
Instructions	Gate codes, billing notes, and access restrictions. Visible to admin only. Does not appear in the field app.

Contacts

Each account can have multiple contacts with role flags for Primary, Secondary, and On-Site. Contact fields include name, title, company, work phone, cell phone, email, and notes. Primary and secondary contacts appear automatically on job cards in both the admin and field views.

Pending Accounts

New customers created in the field or through the Assign Job form are saved with a pending status. Rich reviews and approves them from the Pending panel at the top of the Accounts section. Once approved, the account receives a sequential account number and becomes active throughout the system.

3.7 Settings

The Settings section manages all reference data used throughout the system. Changes here affect available options in dispatch forms, the field app, Stock Prep, and exports.

Tab	Contents
Parts	Parts catalog: name, category, unit, and unit cost. Parts appear in the completion form search and drive Stock Prep totals.
Job Types	List of available job types used in dispatch, the field app, and reporting.
Labor Types	Labor categories with hourly rates used in completion forms and Stock Prep.
Techs	Tech records. Each tech must be linked to a Supabase user account for clock in/out and the My Jobs panel to work.
Users	User account management: add users, assign roles (Admin or Tech), and link user accounts to tech records.

3.8 Export

The Export section produces a CSV file formatted for QuickBooks Desktop import. Recommended practice is to filter to Approved status only, ensuring only priced and reviewed jobs are included in billing.

Date Range	Defaults to January 1 of the current year through today. Adjust as needed.
Status Filter	Approved (recommended), or any other status. Export includes all jobs matching the filter.
Output Format	One row per line item. Jobs with no line items produce one row with blank item fields.
Column Configuration	Column order and field mapping are controlled by export-config.js. Contact ONA to add, remove, or rename columns.

Note: The export is designed for QuickBooks Desktop, not QuickBooks Online. Columns include job date, account name, job reference, job type, WO/PO numbers, item type, description, quantity, unit cost, extended amount, payment detail, tech notes, and job status.

3.9 Activity Log

The Activity Log provides a chronological timeline of system events, grouped by day and displayed newest first. Use it to verify attendance, confirm submission timing, or review the complete audit trail for a job.

Event Type	What Is Recorded
Sign In	User email, timestamp.
Clock In	Job reference, account name, tech name, timestamp.
Clock Out	Job reference, account name, tech name, duration on site, timestamp.
Completion Submitted	Job reference, account name, who submitted it, timestamp.
Admin Review	Job reference, action taken (Approve / Flag / Reset), reviewer name, any notes, timestamp.

Filter by period (Today, This Week, This Month, Custom) or by event type. The clock-in and clock-out filters isolate field attendance data by day.

3.10 My Jobs (Milton Only)

Milton's admin account is linked to his tech record. When logged in as admin, he sees a My Jobs tab that provides the same job management experience as the field app, but within the admin panel interface. This eliminates the need to switch between interfaces.

Filter Options	Today, This Week, All Open.
Job Cards	Account, date, job type, address, primary contact, scope, and clock in/out controls.
Completion Form	Expanding a job card reveals the full completion form identical to the field app.

4. Field App

Thomas, Zach, and Milton access the field app by navigating to https://old-north-analytics.github.io/FaithLS_POC/ on their phone or tablet. After signing in, the system routes them automatically to the field interface. The app is optimized for phone and tablet use. Navigation runs across the top of the screen as four tabs: My Jobs, New Job, Quote, and New Customer.

Note: Pricing is never visible in the field app. All dollar amounts are blocked regardless of role. Techs record items at \$0; pricing is set by Rich during the admin review.

4.1 My Jobs Tab

My Jobs shows all jobs currently assigned to the logged-in tech. Filter by Today, This Week, or All Open. The list loads automatically on sign-in and refreshes on demand.

Job Card Information

Item	Source / Notes
Account name, sub-account	From job record.
Date, job type, reference number	From job record. Reference format: ACCOUNT-SUB-JOB (e.g., 0105-A-01023).
Work order / PO numbers	Entered at dispatch; editable by admin in the edit modal.
Site address	Pulled from account CRM. Tapping it opens Google Maps.
Primary contact name and phone	Pulled from account contacts. Primary contact flag.
Scope of work	Entered at dispatch.
Site notes	Gate codes, parking, access instructions entered at dispatch.
Return visit banner	Shown if a future return visit is already scheduled on this job.
Fixed price warning	Shown if the job is flagged as fixed price. Reminds tech not to exceed scope.
Expected parts/labor banner	Shown if parts or labor were pre-loaded at dispatch. Those items appear pre-filled in the completion form.

Clock In and Clock Out

Each job card has a Clock In button when the tech has not yet started work for the day.

Clock In	Records the start time, writes to the job visit record, and sets the job status to In Progress. Only one active job per tech is allowed at a time. If another job is already active, the system warns before proceeding.
Clock Out	Records the end time to the visit record. The job status stays In Progress until the tech submits a completion. Tapping Job Details after clocking out will show pre-filled time fields.

Completing a Job

Tap Job Details on any card that is not yet submitted. The completion form pre-fills time in/out from clock data if available.

Field	Notes
Time In / Time Out	Pre-filled from clock in/out records. A Now button sets the current time. Edit manually if needed.
Parts Used	Search the parts catalog. Expected parts pre-loaded at dispatch appear automatically. Adjust quantities as needed.
Labor	Select labor type and enter hours worked. Multiple labor entries are allowed.
Additional Charges	Service Call or Other, with description and dollar amount. These become line items at \$0 for admin to price.
Payment Type	Cash, Check, Card, or Invoice.
Payment Detail	Check number, card last four, etc.
Tech Notes	Any notes for the admin reviewer. Not visible to the customer.
Follow-up Flag	Check if the customer needs a follow-up call or visit. Visible to admin in the review queue.
Photos	Upload one or more photos from the device. Images are compressed and stored in the cloud.

Tapping Submit Completion sends the job to Pending Review and locks the completion form. The tech can tap Unsubmit to reverse this, but only before Rich has taken any review action.

4.2 New Job Tab

Allows a tech to create a job in the field for an existing customer. Fields include account, sub-account, job type, date, work order number, scope, site notes, lead tech, and optional pre-loaded parts and labor. The job is created immediately and appears on the admin dispatch board.

4.3 Quote Tab

Used when a tech goes on-site to assess work but does not perform or complete any services. The tech fills out a quote form with scope observed and materials needed. The job is saved in Quoted status and appears in the admin Quotes pipeline for Rich to schedule or reject.

4.4 New Customer Tab

If a customer is not in the system, the tech can add them from the job site. Fields include customer name, address, phone, billing notes, and an optional contact record (name, title, phones, email). The account is saved as pending and must be approved by Rich before it appears in the active account list, in the tech's account search, or in exports.

5. Job Status Reference

Every job carries a status that drives what actions are available, where the job appears in each view, and how it is counted in the dashboard KPIs. The table below documents all valid transitions and their triggers.

From Status	To Status	Trigger
Scheduled	In Progress	Tech clocks in from field app
In Progress	Pending Review	Tech submits completion form
Pending Review	Approved	Rich approves in Review Queue
Pending Review	Flagged	Rich flags for follow-up
Flagged	Pending Review	Reset action in Review Queue
Any active status	Awaiting Parts	Set manually when waiting on parts order
Any status	Cancelled	Admin only; removes from all active views
Quoted	Scheduled	Admin schedules from Quotes pipeline
Quoted	Cancelled	Admin rejects from Quotes pipeline

Note: Jobs in Cancelled status are excluded from all active views, KPI counts, and exports. Cancelled jobs remain in the database and can be viewed from the Accounts section job history.

6. Job Reference Numbers

Every job is assigned a human-readable reference number at creation. This number links a job to its account, sub-account, and sequential job number in a single readable string. Reference numbers appear on job cards, in the dispatch board, in the review queue, in account job history, in the activity log, and in the QuickBooks export.

Format: ACCOUNT-SUB-JOB **Example:** 0105-A-01023

Account Number	4-digit, zero-padded integer. Assigned automatically by the database when a pending account is approved. Sequence starts at 0100.
Sub-account Letter	Single uppercase letter (A, B, C...). Assigned automatically in alphabetical order when a sub-account is created under a master account. Omitted if the job is on a master account directly.
Job Number	5-digit, zero-padded integer. Assigned automatically by the database when the job is created. Sequence starts at 01000 and is shared across all accounts.

Note: If a job is on a master account with no sub-account, the reference omits the sub-account letter segment: e.g., 0105-01023. Visit numbers can optionally be appended: 0105-A-01023-2 for Visit 2.

7. QuickBooks Export

The export function produces a CSV file formatted for import into QuickBooks Desktop. It is not compatible with QuickBooks Online without reformatting. The export produces one row per line item across all jobs in the selected date range and status filter.

7.1 Recommended Export Settings

Date Range	Set to the billing period (e.g., the prior month or quarter).
Status Filter	Approved only. This is the default and the recommended setting. It ensures only jobs that Rich has reviewed and priced are included.

7.2 Column Configuration

The column order and field mapping are defined in a single configuration file: export-config.js. If Brenda needs columns added, renamed, or reordered, that file is the only place to change. No other files need to be modified.

Standard columns included in the export:

Column	Source
Job Date	From the job record.
Job Reference	Computed from account number, sub-account letter, and job number.
Account Name	From the account record.
Sub-Account Name	From the sub-account record, if applicable.
Job Type	From the job type reference table.
Work Order Number	Entered at dispatch.
Purchase Order Number	Entered at dispatch.
Item Type	Part, Labor, Service Call, or Other.
Description	Part name, labor type name, or override reason.
Quantity	Units or hours.
Unit Cost	Override cost if set; otherwise, the catalog cost.
Extended Amount	Unit cost multiplied by quantity.
Payment Type	From job completion record.
Payment Detail	From job completion record.
Tech Notes	From job completion record.
Job Status	Status at time of export.

8. Operational Best Practices

The following practices represent the recommended operating discipline for getting the most out of the system and avoiding common issues.

8.1 For Rich (Admin)

Best Practice: Always approve jobs before running the export. Approved status is the billing cutoff. Jobs in any other status are excluded from the Approved-only export.

Best Practice: Review pending accounts promptly after a field tech creates a new customer. Jobs tied to pending accounts cannot appear in exports until the account is approved.

Best Practice: Use the admin note field in the Review Queue rather than phone or text to document review decisions. Notes are timestamped and tied to the job record.

Best Practice: If a job needs a return visit, use the Return Visit button on the dispatch board rather than creating a new job. This keeps all visit history and completion data under one job record.

8.2 For Techs

Best Practice: Clock in when you arrive on site. The clock-in timestamp feeds the completion form's Time In field and records your presence in the Activity Log.

Best Practice: If you submit a job in error, use Unsubmit to roll it back -- but only before Rich has taken any action in the Review Queue.

Best Practice: Pre-loaded parts and labor are a starting point. Adjust quantities in the completion form to match what was actually used.

8.3 For All Users

Best Practice: Use site notes in the dispatch form for gate codes, parking instructions, and access details. Site notes appear in the field app and print on the job summary sheet.

Best Practice: The activity log is the fastest way to confirm that a tech clocked in or out on a given day, or that a job was submitted and reviewed.

Note: The Fixed Price flag on a job prevents techs from seeing dollar amounts in the field app. All tech line items are recorded at \$0 regardless; Rich sets actual prices during the review.

9. Support and Maintenance

This system was built by Old North Analytics (ONA) as a pro bono engagement for Faith Lock & Safe Co. The sections below cover what to do when issues arise and what the system requires to keep running.

9.1 Technical Requirements

Browser	Chrome or Firefox. Current versions recommended. Safari and Edge will work but are not officially tested.
Device	Any device with a web browser. The field app is optimized for phones and tablets. The admin panel works best on a laptop or desktop.
Internet	Required. All data reads and writes go to the Supabase cloud database. The app does not function offline.
Installation	None. No software installation required beyond a web browser.

9.2 Infrastructure

Database	Supabase (supabase.com). All job, account, contact, and photo data is stored here. Supabase project ID: jmsrlhqbzstuczxlxua.
Application	Plain HTML and JavaScript files hosted on GitHub Pages. Available at https://old-north-analytics.github.io/FaithLS_POC/ from any device with a web browser. Any update pushed to the repository deploys automatically within seconds.
Authentication	Supabase Auth. Passwords and sessions are managed by Supabase's authentication service.
Photo Storage	Supabase Storage. Photos are resized on upload and stored in the job-photos bucket.

9.3 Getting Help

For questions, bug reports, or change requests, contact your ONA representative. Changes to column configuration (export-config.js), reference data (parts, job types, labor types), or user accounts can be made directly within the application under Settings. Changes to the application code or database schema require ONA involvement.
